Market Intelligence

The past year has seen a resurgence in activity in nuclear. The recent focus on energy security has highlighted the true potential of nuclear as the only baseload and carbon-free energy source. Several countries have reversed or delayed previous phase-out schemes for nuclear, such as Sweden and Belgium. Currently over 260 GW of nuclear is under development globally, including some countries developing nascent nuclear programmes, such as Poland.

France, which currently derives nearly 70% of its electricity from nuclear, had previously planned to reduce this share to 50%. However, in 2022 President Macron announced plans to build six new reactors and parliamentary discussions will occur this year to revise the multi-annual energy programme. In January 2023, the French Senate proposed a bill to accelerate procedures to facilitate the construction of new nuclear installations at existing sites.

New technologies, such as SMRs, offer huge potential growth for the industry. In Europe alone, 12 countries have declared intentions to develop SMR programmes, with some projects planned to be operational as early as 2029. Many MoUs signed for these programmes involve international collaboration between countries and developers, such as Rolls Royce, Nuward, and NuScale. The next decade and beyond offers extensive opportunities for the nuclear industry; this level of new construction has not been seen since the 1970s. However, to meet the construction demands of both new conventional nuclear and SMRs, a huge scale up of the supply chain will be required.
